

## SAVINGS BY THE MINUTE

### Efficient HR Management & Smart Communications

With robust reporting and role-based permissions, System Manager provides advanced human resource tracking in one easy-to-use application. System Manager automatically collects data from Genus series terminals – tracking activity, generating reports and distributing communications easily and efficiently.

Designed with a web-based interface, System Manager allows users to access data from virtually any location using an Internet connection and web browser. Role-based permissions allow different employees access to different levels of information. Management can track data such as: labor activity, employee statistics, terminal interaction and transaction reports.

Information and reports can also be distributed by access level, allowing Management to efficiently communicate information with a variety of employees and departments. System Manager's detailed record keeping even allows report data to be filtered by date, site, location, employee, transaction type or terminal.

**System Manager is designed to meet any organization's needs, with features including:**

**Multi-Site Organization** - data collection can be sorted by grouping terminals into separate sites and/or locations. Groupings can also be divided into multiple locations allowing for greater control over access restrictions.

**User Management with Secure Auditing** - All modifications to System Manager settings can be tracked, ensuring database integrity and security.

**Role-Based Permissions** - Information can be easily accessed and distributed directly to individuals, departments or groups – without the need for management intervention or HR support.

**System Manager provides flexible human resource tracking and efficient data communications, with the accessibility required for today's busy management professionals.**

System Manager® is a registered trademark of Control Module, Inc.

### System Manager Benefits

An efficient human resource management tool, System Manager offers complex reporting and easy information distribution. The application provides:

- Easy-to-use and understand, web-style interface.
- Remote access via Internet.
- Task scheduling.
- Batch terminal management.
- Customizable pay codes.
- Automated data collection.
- Advanced reporting with export into Microsoft Excel or as Acrobat Reader PDFs.
- Extensible for future growth.

### Specifications

#### Operating System Options

- Windows Server 2003 or later
- MS SQL Server 2005 or later

#### Minimum System Requirements

- 1 GHz CPU
- 256 MB Ram
